# Develop, deploy, and manage custom AI solutions easily

# Speed up AI productization by leveraging frontier AI and SAP foundation models

## Model Access

Implement a wide range of models: SAP and specialized third-party models from leading frontier providers, or bring your own model.

## Model Exploration

Experiment and optimize prompts to easily move between models to find and upgrade to the best suited technology for your needs. No need for individual contracts and no lock-in to ultimately boost the ROI of your AI projects.

# Automated and efficient prompt optimization

## Maximize prompt efficiency

by automating benchmark engineering, evaluation, and optimization tasks through a single API

## Increase precision

with systematic data-driven optimizations, ensuring consistent results and accuracy across models

## Strength oversight

with centralized prompt optimization processes to meet local and global compliance.

# Prompt optimization in action

Start → Create a data set → Create a base prompt → Run prompt optimizer → Evaluate results → Consume optimized prompt

# Benefit from less maintenance with orchestration workflows

## Powerful workflows

that connect diverse components like data pipelines, AI models, and pre-built modules.

## Contextual and reliable outputs

with document grounding to automatically integrate external, internal, or real-time data into AI processes.

## Streamlined prompt lifecycle

with prompt templating to create reusable templates dynamically retrievable with prompt registry.

## Secure and responsible AI

with data masking and content filtering, to mask personally identifiable information or filter undesirable inputs and outputs.

## Immediate LLM access

to seamlessly switch between SAP, third-party, or your own models and across use cases.

# Enhance user satisfaction and ground your AI in business context

## Automatically enrich

requests with relevant business context by integrating external, domain-specific, or real-time data into AI processes.

## Seamlessly onboard

data via supported repositories or Vector API for strategic decision-making and improved content reliability.

## Leverage vector databases

to convert documents into actionable insights and optimize your AI-driven business solutions.

# Streamline the AI lifecycle with prompt templates

## Define reusable prompt templates

that can cover multiple messages, contain defaults, and resolve placeholders at.

## Retrieve

just the right prompt template dynamically with prompt registry for managing templates centrally (future scope) and streamline the lifecycle of prompt templates.

Translation

## Accelerate and streamline translation of software and documents

### Include translation in every AI workflow

Translate prompts, documents, and responses within SAP ensuring consistent, governed multilingual experiences across AI workflows.

### Scale across 40+ languages

Reusing SAP's multilingual assets so every orchestrated interaction feels local and consistent.

# Predictive insights with SAP-RPT-1.6

Generally available

## Unified and evolving

Optimize tabular processes with better performance, explainability, and integration.

## Accurate and connected

Embed predictive intelligence into business processes through tabular orchestration.

## Centralized and automated

Strengthen security, compliance, and performance while reducing manual effort through automated content selection and context engineering.

## Explainable and actionable

See which rows and columns drive predictions to improve trust and decision-making.

## Built for use case fit

Support classification, regression, and record matching with model options that balance speed and accuracy.

The screenshot displays the SAP-RPT-1.6 user interface. On the right, a table titled "Equipment Sourcing" shows 50 rows of data. The table has columns for "OrderID", "CO2e", and "Product". The "CO2e" column contains values like 58.1, 85.1, 78.6, and a "[PREDICT]" button. The "Product" column lists items like "Printer Ton", "Keyboard", "Paper Rear", and "Office Cha". A sidebar on the left provides predictive insights for the "Equipment Sourcing" table. It includes a welcome message, a summary of the data (50 rows, spanning Products, Groups, and CO2e), and a list of insights. For example, it notes that "Laptops" dominate the "Product" column (24% of all entries) and that "Electronics" leads the "Group" category (48% of the data). It also mentions that "CO2e" values range from 24.8 to 189.5, suggesting significant variability in emissions. The sidebar includes a button to "Predict CO2e for marked rows" and a "QUICK ACTIONS" section with a prompt: "Pretend that CO2e emissions raise 10%, show me how insights are affected, and possible data relationships and correlations". A footer note states "Joule uses AI, verify results."

| OrderID | CO2e      | Product     |
|---------|-----------|-------------|
| ORD92   | 58.1      | Printer Ton |
| ORD39   | 85.1      | Keyboard    |
| ORD25   | 78.6      | Paper Rear  |
| ORD14   | [PREDICT] | Office Cha  |
|         | 115.4     | Laptop      |
|         | 136.1     | Desk        |
| ORD28   | 118.3     | Monitor     |
| ORD24   | 70.9      | Printer Ton |
| ORD80   | 40.8      | Keyboard    |
| ORD22   | 46.8      | Paper Rear  |

Example user interface from SAP-RPT Playground

Orchestration

# Deliver secure and responsible AI with data masking and filtering

**Mask personally identifiable information** while keeping context to help ensure data privacy and avoid certain types of biases.

## Filter

undesirable inputs and outputs to provide safe and responsible AI use cases.

Evaluation

## Deliver trust in every AI decision

### Comprehensive evaluation and benchmarking

Ensure data privacy and avoid certain types of biases by measuring what matters to the business while keeping context.

### Trustworthy process and applications

Deploy solutions with verified quality that reduces risk and guesswork while protecting customers and the company.

**Start**

[illegible]

# SDKs and client libraries

Gain freedom without lock-in with infrastructure flexibility

## Leverage developer focused tooling

such as powerful SDKs and client libraries to enhance your applications with generative AI and build new custom AI solutions much faster and easier.

## Use popular AI coding agents and gateways

like LiteLLM, Cline, and OpenCode to keep familiar tools while all model calls are routed through SAP's secure, governed AI platform.

## Model Access

The SAP Cloud SDK for AI provides model access by wrapping the native SDKs of the model providers.

# Get started

with AI services and models in the SAP Business AI Platform

01

Start your learning journey and bring your projects to life

02

Engage with Generative AI Hub users on SAP Community

03

Try it for free and start building a custom AI solution

The beginning of better.

**Thank you**
